59. Describe in detail your understanding of embedded and linked charts. Discuss their differences and similarities and properly define the terms “source file,” “destination file,” and “source program.”

ANSWER: An embedded chart is an object that is created in a source program, such as Excel, and then inserted to a PowerPoint slide, known as the destination file. An embedded chart becomes a part of the destination file and can be edited in its source program by double-clicking the object. An embedded Excel chart’s data is actually stored in an Excel worksheet that is included with the PowerPoint file.

A linked chart is also created in another program, or source program, and is saved in another file known as a source file. A linked chart is not saved in the destination file. A representation or picture of the linked chart is inserted into the destination file instead of the actual chart. A linked chart can be double-clicked to edit it in its source program.

60. Explain how a chart is animated. Be sure to describe which parts of the chart can be animated and how the animation works.

ANSWER: A chart can be animated as one object, or you can animate the data markers. If the chart is animated as a whole, the entire chart, including the chart background, animate together. If the data markers are animated individually, there are two available choices: by series and by category.

The by series option allows the data markers by each series to be animated. The data markers can be animated individually or as a group.
