SHORT ANSWER. Write the word or phrase that best completes each statement or answers the question.

Provide an appropriate response.

- 204) What are the ways to round off a number?

Answer: If the digit to the right of the one you are rounding to is 5 or larger add 1 to the digit you are rounding to. If the digit is 4 or smaller, do not change it. Drop all digits to the right of the digit you are rounding to. Replace each dropped digit to the left of the decimal point, if any, with 0. Another way is truncation. Drop all the digits to the right of a given decimal place.

- 205) Explain why you would use zeros to fill in for missing digits to the right of the decimal point when adding or subtracting decimals.

Answer: It helps reduce errors by making it easier to see which column a digit is in.

- 206) Why don't you have to line up decimal points in a vertical column when multiplying decimals?

Answer: The number of decimal places in the product is found by adding the number of decimal places in each factor.

207) Explain how you multiply a decimal number by a power of ten.

Answer: Move the decimal point to the right the number of places equal to the number of zeros in the power of ten.

208) Why must decimal points be lined up in division of decimals?

Answer: It keeps digits with like place values in the same column. This is important because you subtract in division, and like named digits must be in the same column.

209) Explain how you divide a decimal number by a power of ten.

Answer: Move the decimal point to the left the number of places equal to the number of zeros in the power of ten.

210) Explain the difference between terminating and repeating decimals.

Answer: The division of the numerator and denominator of a fraction terminates by giving a remainder of 0 as you carry out the division. A repeating decimal has one or more digits repeat over and over as you carry out the division.
