

# **Solutions Manual for Cost Accounting Foundations & Evolutions 10th Kinney**

# CHAPTER 2

## Cost Terminology and Cost Behaviors

### QUESTIONS

- Q2-1.** The term *cost* is used to refer to so many different concepts that an adjective must be attached to identify which particular type of cost is being discussed. For example, there are fixed costs, variable costs, period costs, product costs, expired costs, and opportunity costs, to name just a few.
- Q2-2.** A cost object is anything for which management wants to collect or accumulate costs. Before a cost can be specified as direct or indirect, the cost object must be identified. Since direct costs must be conveniently and economically traceable to the cost object, not knowing what the cost object in question is would make it impossible to identify direct costs. For example, if multiple products are made in the same production area, the salary of the area's manager would be direct to the production area but indirect to the different products. Indirect costs must be allocated in some rational and systematic manner to the cost object.
- Q2-3.** The assumed range of activity that reflects the company's normal operating range is referred to as the *relevant range*. Outside the relevant range, costs may be curvilinear because of purchase discounts, improved worker skill and productivity, worker crowding, loss in employee efficiency during overtime hours, etc. Although a curvilinear graph is more indicative of reality, it is not as easy to use in planning or controlling costs. Accordingly, accountants choose the range in which these fixed and variable costs are assumed to behave as they are defined (linear) and, as such, represent an approximation of reality.
- Q2-4.** It is not necessary for a causal relationship to exist between the cost predictor and the cost. All that is required is that there is a strong correlation between movement in the predictor and the cost. Alternatively, a cost driver is an activity that actually causes costs to be incurred.

The distinction between cost drivers and predictors is important because it relates to one of the objectives of managers: to control costs. By focusing cost control efforts on cost drivers, managers can exert control over costs. Exerting control over predictors that are not cost drivers will have no cost control effect.

- Q2-5.** A product cost is one that is associated with inventory. In a manufacturing company, product costs would include direct material, direct labor, and overhead. In a merchandising company, product costs are the costs of purchasing inventory and the related freight-in costs. In a service company, product costs are those costs that are incurred to generate the services provided such as supplies, service labor, and service-related overhead costs.

In all three types of organizations, a period cost is any cost that is not a product cost. These costs are noninventoriable and are incurred in the nonfactory or nonproduction areas of a manufacturing company or in the nonsales or nonservice areas, respectively, of a retailer or service company. In general, these costs are incurred for selling and administrative activities. Many period costs are expensed when incurred, although some may be capitalized as prepaid expenses or other nonfactory assets.

- Q2-6.** Conversion costs are all production costs other than direct material costs; thus, conversion costs include the costs of direct labor and manufacturing overhead. These items are called conversion costs because they are needed to convert direct material into a salable product.
- Q2-7.** Factory overhead has been growing most rapidly because of the costs of technology. This cost category includes depreciation of factory and plant equipment, machinery maintenance cost, repair cost, some training costs, utilities expense to operate the machinery, and many costs related to quality control.
- Q2-8.** The only difference between the two systems is in their treatment of overhead. Under an actual cost system, actual overhead is added to production. Because actual overhead cannot be determined until the period ends, the overhead allocation occurs and product cost can be determined only at period-end. Under a normal cost system, a predetermined overhead rate is calculated before a period begins and is then used to apply overhead to products as production occurs.

The major advantage of using a normal cost system is that it allows a product's cost to be determined (estimated) at the time of production. Another major advantage is that a normal cost system provides a product cost that is stable across fluctuating levels of production and sales.

- Q2-9.** The cost of goods manufactured is the total production cost of the goods that were completed and transferred to Finished Goods Inventory during the period. This amount is similar to the cost of net purchases in the cost of goods sold schedule for a retailer. Since CGM is used in computing cost of goods sold, it appears on the income statement.

|                                    | COST OBJECT    |                     |             |
|------------------------------------|----------------|---------------------|-------------|
|                                    | <u>Kennedy</u> | <u>Tax Services</u> | <u>Firm</u> |
| a. Four hours of Perkins's time    | Direct         | Unrelated           | Direct      |
| b. Six hours of assistant's time   | Direct         | Direct              | Direct      |
| c. Three hours of Morris's time    | Indirect       | Indirect            | Direct      |
| d. Eight hours of CPE for Tompkin  | Indirect       | Direct              | Direct      |
| e. One hour at lunch               | Unrelated      | Unrelated           | Unrelated   |
| f. Two hours of Perkins's time     | Direct         | Unrelated           | Direct      |
| g. One-half hour of Tompkin's time | Direct         | Direct              | Direct      |
| h. Janitorial wages                | Indirect       | Indirect            | Direct      |
| i. Seven hours of Tompkin's time   | Direct         | Direct              | Direct      |

**E2-13.**

- a. Cardboard, \$0.40; cloth, \$1; plastic, \$0.50; depreciation, \$0.60; supervisors' salaries, \$1.60; and utilities, \$0.30; total cost, \$4.40.
- b. Cardboard, variable; cloth, variable; plastic, variable; depreciation, fixed; supervisors' salaries, fixed; and utilities, mixed.
- c. If the company produces 10,000 caps this month, the total cost per unit will increase. The variable costs (cardboard, cloth, plastic) will remain constant per unit. The total cost for depreciation and supervisors' salaries will remain fixed, and, thus, will result in a higher cost per unit. The utility cost will go down in total but, because it is mixed, it is impossible (without other information) to estimate its total or per-unit cost. Without knowing the cost formula for utility costs, it is impossible to determine the total cost of making 10,000 caps.

**E2-14.**

- a. and b.

|                                                        | <u>Per Unit</u> | <u>Per Set</u> |
|--------------------------------------------------------|-----------------|----------------|
| Cardboard boxes ( $\$1,000 \div 2,000$ )               | \$0.50          | \$0.50         |
| Mallets ( $\$12,000 \div 4,000$ )                      | 3.00            | 6.00           |
| Croquet balls ( $\$9,000 \div 12,000$ )                | 0.75            | 4.50           |
| Wire hoops ( $\$3,600 \div 24,000$ )                   | 0.15            | 1.80           |
| Production worker wages ( $\$8,400 \div 2,000$ )       | ?               | 4.20           |
| Supervisor's salary ( $\$2,600 \div 2,000$ )           | ?               | 1.30           |
| Building and equipment rental ( $\$2,800 \div 2,000$ ) | ?               | 1.40           |
| Utilities ( $\$1,300 \div 2,000$ )                     | <u>?</u>        | <u>0.65</u>    |
| Total                                                  |                 | <u>\$20.35</u> |

- c. Estimated cost per set in March is:

|                                                             |                |
|-------------------------------------------------------------|----------------|
| Cardboard boxes ( $\$1,000 \div 2,000$ )                    | \$0.50         |
| Mallets ( $\$12,000 \div 4,000$ ; $\$3 \times 2$ )          | 6.00           |
| Croquet balls ( $\$9,000 \div 12,000$ ; $\$0.75 \times 6$ ) | 4.50           |
| Wire hoops ( $\$3,600 \div 24,000$ ; $\$0.15 \times 12$ )   | 1.80           |
| Production worker wages ( $\$8,400 \div 2,000$ )            | 4.20           |
| Supervisor's salary ( $\$2,600 \div 2,500$ )                | 1.04           |
| Building and equipment rental ( $\$2,800 \div 2,500$ )      | 1.12           |
| Utilities ( $\$1,400 \div 2,500$ )                          | <u>0.56</u>    |
| Total                                                       | <u>\$19.72</u> |

**E2-15.**

- |    |                                                                                                                                                                                                                                                                                                         |                  |                   |

|    | Total cost:                                                                                                                                                                                                                                                                                             |                  |                   |
|    | Fixed                                                                                                                                                                                                                                                                                                   | \$37,500         |                   |
|    | Variable (5,000 × \$10)                                                                                                                                                                                                                                                                                 | <u>50,000</u>    | <u>(87,500)</u>   |
|    | Net profit                                                                                                                                                                                                                                                                                              |                  | <u>\$ 15,000</u>  |
| d. | The assumption made was that 15,000 tickets would be sold. The fraternity should have been informed that the fixed cost per ticket would vary, depending on the number of tickets sold. By spreading the fixed cost over fewer tickets, the fraternity would make less profit as ticket sales declined. |                  |                   |
| e. | Total revenue (20,000 tickets × \$20.50)                                                                                                                                                                                                                                                                |                  | \$ 410,000        |
|    | Total cost:                                                                                                                                                                                                                                                                                             |                  |                   |
|    | Fixed                                                                                                                                                                                                                                                                                                   | \$ 37,500        |                   |
|    | Variable (20,000 × \$10)                                                                                                                                                                                                                                                                                | <u>200,000</u>   | <u>(237,500)</u>  |
|    | Net profit                                                                                                                                                                                                                                                                                              |                  | <u>\$ 172,500</u> |

**E2-16.**

- a. (1) 200 returns:  
Total cost = \$2,000 + (\$9 × 200) = \$3,800  
Cost per unit = \$3,800 ÷ 200 = \$19.00
- (2) 500 returns:  
Total cost = \$2,000 + (\$9 × 500) = \$6,500  
Cost per unit = \$6,500 ÷ 500 = \$13.00
- (3) 800 returns:  
Total cost = \$2,000 + (\$9 × 800) = \$9,200  
Cost per unit = \$9,200 ÷ 800 = \$11.50
- b. The fixed cost per unit varies inversely with activity. Therefore, as the activity (tax returns prepared) increases, the fixed cost per unit decreases.
- c. \$15,000 ÷ 200 = \$75; \$75 + \$19 = \$94 fee to charge per return  
\$94 × 800 = \$75,200 total fees; \$75,200 – \$9,200 = \$66,000

**E2-17.**

- a. (1) Number of clients contacted, number of new clients generated, number of miles traveled (if driving), number of nights away from home.
- (2) Number of supplies requisitions, number of hours worked, number of copies made
- (3) Purchase price of computers and depreciation method chosen (number of hours of computer usage, number of hours worked, expected years of service)
- (4) Number of hours worked, number of times maintenance crew visits the accounting firm, number of months in period (if maintenance is a strict fixed cost per month)
- b. The distinction between a cost predictor and a cost driver is whether the activity measure actually causes the cost to be incurred. A cost predictor is merely an activity that changes with changes in the cost. A cost driver *causes* costs to be incurred. Of the costs addressed in (a), cost drivers that could also be cost predictors would be (1) number of miles traveled, (2) number of times supplies are requisitioned, (3) number of hours worked, and (4) number of times maintenance visited the accounting firm.

**E2-18.**

- a. Number of patients processed
- b. Number of patients scheduled
- c. Number of surgeries scheduled
- d. Number of surgeries scheduled
- e. Number of tests ordered
- f. Number of patients getting tests (if all tests are performed in same lab at the same time) or number of tests ordered (if patient has to be moved to multiple labs or for multiple tests)
- g. Number of lab tests administered
- h. Number of patients moved
- i. Number of surgeries performed
- j. Number of surgeries performed
- k. Number of medications administered
- l. Number of patients moved
- m. Number of patients discharged (it is possible that not all patients are discharged)
- n. Number of insurance companies to be billed

**E2-19.**

- a. V, PT (could be mixed)
- b. V, PD
- c. F, PD
- d. V, PT
- e. F, PT
- f. V, PT (could be fixed if paper towel rolls are replaced at specific intervals regardless of need)
- g. F, PD (could be product if assistants are assigned to work on specific projects)
- h. V, PT (could be fixed)
- i. V, PT
- j. V, PT
- k. F, PT (would be fixed because it was charged for the truckload rather than for an individual piece of furniture; may be considered a period cost and not attached to the individual pieces of furniture)

**E2-20.**

- a. F, OH
- b. V, DM
- c. V, DM
- d. V, OH (assuming cost is insignificant)
- e. V, DM
- f. F, OH
- g. V, DM
- h. F, OH
- i. F, OH
- j. V, DM
- k. V, DL
- l. V, DM
- m. V, DM
- n. V, DM

**E2-21.**

- a.  $\$600,000 - \$60,000 = \$540,000$  depreciable cost  
 $\$540,000 \div 10 \text{ years} = \$54,000$  depreciation per year  
 $(480 \div 600) (\$54,000) = \$43,200$  is expired cost (part of product OH)
- b. Cost of goods sold:  $\$43,200$   
 Finished goods inventory:  $\$10,800$

**E2-22.**

- a.
 

|                                                         |                 |
|---------------------------------------------------------|-----------------|
| One month of insurance ( $\$18,600 \div 6$ )            | \$ 3,100        |
| Bonus to corporate president                            | 10,000          |
| Utility cost on headquarters ( $\$20,000 \times 0.40$ ) | <u>8,000</u>    |
| Total                                                   | <u>\$21,100</u> |
- b.
 

|                                                    |                 |
|----------------------------------------------------|-----------------|
| Five months of insurance ( $\$18,600 \times 5/6$ ) | \$15,500        |
| Seminar fee                                        | <u>1,000</u>    |
| Total                                              | <u>\$16,500</u> |
- c.
 

|                                                    |                 |
|----------------------------------------------------|-----------------|
| Property taxes ( $\$15,000 \times 1/3$ )           | \$ 5,000        |
| Utility cost on factory ( $\$20,000 \times 0.60$ ) | <u>12,000</u>   |
| Total                                              | <u>\$17,000</u> |
- d. Product costs are assigned to products made; thus, the costs cannot be classified as expired or unexpired because it is not known whether the associated products made during May were sold. If sold, the costs would be expired; if unsold, the costs would be unexpired and be accumulated in the Finished Goods account.

**E2-23.**

- a. Mfg.
- b. Mfg., Mer., Ser.
- c. Mfg., Mer., Ser.
- d. Mer. (although manufacturers might refer to Finished Goods Inventory in this manner)
- e. Mfg., Mer., Ser.
- f. Mfg.
- g. Ser.
- h. Mfg., Mer.
- i. Mfg., Ser.

**E2-24.**

- a. high
- b. low
- c. low
- d. high
- e. high
- f. high
- g. moderate
- h. high
- i. high
- j. moderate or low

**E2-25.**

- a. Rivets and aluminum =  $\$12,510 + \$1,683,000 = \$1,695,510$   
The janitorial supplies and the sealant are indirect materials.
- b. Aluminum cutters and welders =  $\$56,160 + \$156,000 = \$212,160$   
The janitorial wages and factory supervisors' salaries are indirect labor.  
The salespeople's salaries are period costs.

**E2-26.**

- a. Stainless steel, plastic, and wood blocks =  $\$800,000 + \$5,600 + \$24,800 = \$830,400$
- b. \$500,000 (equipment operators)
- c. \$6,000 indirect material (equipment oil and grease)  
 $\$82,000 + \$272,000 = \$354,000$  indirect labor (mechanics and supervisors)

**E2-27.**

## Direct material:

|                  |              |         |
|------------------|--------------|---------|
| Mulch            | \$ 320       |         |
| Landscaping rock | 1,580        |         |
| Plants and pots  | <u>1,950</u> | \$3,850 |

## Direct labor:

|                                                                         |            |         |
|-------------------------------------------------------------------------|------------|---------|
| Trumble's salary                                                        |            |         |
| ( $\$3,000 \div 20 = \$150$ per day; $\$150 \times 2$ days to design)   | \$ 300     |         |
| Gardeners' wages                                                        |            |         |
| ( $\$3,840 \div 20 = \$192$ per day; $\$192 \times 5$ days to complete) | <u>960</u> | \$1,260 |

## Overhead:

|                                                                                |           |        |
|--------------------------------------------------------------------------------|-----------|--------|
| Allocated depreciation ( $\$200 \div 20$ work days)                            | \$ 10     |        |
| Construction permit                                                            | 95        |        |
| Allocated rent                                                                 |           |        |
| ( $150 \div 3,000 = 5\%$ ; $\$2,400 \times 0.05 = \$120$ ; $\$120 \div 30$     |           |        |
| = \$4 per day $\times 2$ days)                                                 | 8*        |        |
| Allocated utility bills                                                        |           |        |
| ( $\$1,800 \times 0.05 = \$90$ ; $\$90 \div 30 = \$3$ per day $\times 2$ days) | <u>6*</u> | \$ 119 |

\*Note: The rent and utility bills were allocated only because of the designer's use of space in the company offices. Given the immaterial amount of these allocations, Carolyn Gardens may simply want to treat these costs as period costs rather than attempting to trace them to individual jobs. Thus, an answer of \$105 for overhead would also be reasonable.

**E2-28.**

a. 6,000 total hours – 5,000 regular hours = 1,000 overtime hours

b. Direct labor: 5,000 hours  $\times$  \$9 per hour = \$45,000  
Overhead: \$54,000 – \$45,000 = \$9,000

c. Shift premiums:  
Second-shift premium:  $10\% \times \$9 = \$0.90$   
Overtime premium:  $75\% \times \$9 = \$6.75$

## Overhead costs:

Second-shift premium: 2,500 hours  $\times$  \$0.90 = \$2,250  
Overtime premium: 1,000 hours  $\times$  \$6.75 = \$6,750

**E2-29.**

a. 32,000 total hours – 27,000 regular hours = 5,000 overtime hours

b. Direct labor: 32,000 hours × \$12 per hour = \$384,000  
Overhead: \$435,600 – \$384,000 = \$51,600

c. Shift premiums:

Second-shift premium: 8% × \$12 = \$0.96

Third-shift premium: 12% × \$12 = \$1.44

Overtime premium: 50% × \$12 = \$6.00

Manufacturing overhead costs:

Second-shift premium: 9,000 hours × \$0.96 = \$8,640

Third-shift premium: 9,000 hours × \$1.44 = \$12,960

Overtime premium: 5,000 hours × \$6.00 = \$30,000

**E2-30.**

a. Property tax overhead cost for February = \$48,000 ÷ 12 = \$4,000

Property tax OH cost for remainder of year = \$44,000

Actual Feb. OH costs = \$530,000 – \$124,000 – \$44,000 + \$81,000 = \$443,000

b. February OH cost per unit = \$443,000 ÷ 50,000 = \$8.86

Total product cost in February = \$24.30 + \$10.95 + \$8.86 = \$44.11

c. If actual costs are used, product costs will differ each period. For example, January utility cost per unit was (\$124,000 ÷ 50,000), or \$2.48, compared to February's cost per unit of (\$81,000 ÷ 50,000), or \$1.62. However, a normal cost system uses a predetermined overhead rate that provides a smoothing effect to overhead cost variations over an annual period.

**E2-31.**

|                                            |                  |
|--------------------------------------------|------------------|
| Direct material used                       | \$ 24,000        |
| Direct labor                               | 126,000          |
| Overhead                                   | <u>42,000</u>    |
| Current manufacturing costs                | \$192,000        |
| Less increase in work in process inventory | <u>(23,000)</u>  |
| Cost of goods manufactured                 | <u>\$169,000</u> |

Since Work in Process Inventory increased by \$23,000, current manufacturing costs must have been \$23,000 more than cost of goods manufactured.

**E2-32.**

|                            |                |                     |
|----------------------------|----------------|---------------------|
| a. Beginning WIP inventory |                | \$ 372,000          |
| Raw material used          | \$612,000      |                     |
| Direct labor               | 748,000        |                     |
| Manufacturing overhead     | <u>564,000</u> | <u>1,924,000</u>    |
| Total cost to account for  |                | \$ 2,296,000        |
| Ending WIP inventory       |                | <u>(436,000)</u>    |
| Cost of goods manufactured |                | <u>\$ 1,860,000</u> |

*Note:* The beginning and ending balances of Raw Material Inventory are not used because no information is given on raw material purchases for the month but the amount of RM used is specifically provided.

|----------------------------------------------------------------------------------|--------------------|
| Beginning WIP inventory ( <i>given</i> )                                         | \$ 90,000          |
| Direct material:                                                                 |                    |
| Beginning DM inventory ( <i>given</i> )                                          | \$ 30,000          |
| Direct material purchased                                                        | <u>1,182,000</u>   |
| Direct material available                                                        | \$1,212,000        |
| Ending DM inventory ( <i>given</i> )                                             | <u>(42,000)</u>    |
| Direct material used                                                             | 1,170,000          |
| Direct labor                                                                     | 400,000            |
| Overhead                                                                         | <u>900,000</u>     |
| Total cost to account for                                                        | \$2,560,000*       |
| Ending WIP inventory ( $\$90,000 \times 0.25$ )                                  | <u>(22,500)</u>    |
| Cost of goods manufactured [from (a)]                                            | <u>\$2,537,500</u> |

\* Total cost to account for = Beg. WIP + DM used + DL + OH

$\$2,560,000 = \$90,000 + \$1,170,000 + \text{DL} + \text{OH}$

$\text{DL} + \text{OH} = \$2,560,000 - \$90,000 - \$1,170,000$

$\text{DL} + \text{OH} = \$1,300,000$

$\text{OH} = 225\% \text{ of DL} = 2.25 \text{ DL}$

$\text{DL} + 2.25 \text{ DL} = \$1,300,000$

$3.25 \text{ DL} = \$1,300,000$

$\text{DL} = \$400,000$

$\text{OH} = \$400,000 \times 2.25 = \$900,000$

c. Prime cost = DM + DL

=  $\$1,170,000 + \$400,000$

=  $\$1,570,000$

d. Conversion cost = DL + OH

=  $\$400,000 + \$900,000$

=  $\$1,300,000$

\*Some variable costs would be direct if miles to and from particular jobs are recorded.

**P2-38.**

- a. At 80,000 boxes per month: \$158.00  
 Material and labor costs ( $\$79,000 \div 500$ )  
 Overhead ( $\$408,000 \div 80,000$ ) 5.10  
 Total cost per box \$163.10
- b. At 120,000 boxes per month:  
 Material and labor costs ( $\$79,000 \div 500$ ) \$158.00  
 Overhead ( $\$408,000 \div 120,000$ ) 3.40  
 Total cost per box \$161.40
- c. Material and labor (excluding labor design) \$118.00  
 Overhead 3.40  
 Total \$121.40
- Cost at 80,000 boxes \$163.10  
 Cost at 120,000 boxes (excluding labor design) (121.40)  
 Maximum labor design costs \$ 41.70
- d. At 80,000 boxes:  
 Sales ( $\$195 \times 80,000$  boxes) \$ 15,600,000  
 Cost of sales ( $\$163.10 \times 80,000$  boxes) (13,048,000)  
 Gross margin \$ 2,552,000
- Desired gross margin \$ 2,552,000  
 Cost of sales ( $\$161.40 \times 120,000$  boxes) 19,368,000  
 Sales needed \$ 21,920,000
- $\$21,920,000 \div 120,000$  boxes = \$182.67 sales price per box
- e. No, the variable costs per box are constant and the fixed costs remain the same in total at any level of production.

**P2-39.**

|                                                                 |                |
|-----------------------------------------------------------------|----------------|
| a. At 150,000 meals per month:                                  |                |
| Material and labor costs ( $\$9,320 \div 2,000$ )               | \$ 4.66        |
| Overhead ( $\$1,200,000 \div 150,000$ )                         | <u>8.00</u>    |
| Total cost per meal                                             | <u>\$12.66</u> |
| b. At 300,000 meals per month:                                  |                |
| Material and labor costs ( $\$9,320 \div 2,000$ )               | \$ 4.66        |
| Overhead ( $\$1,200,000 \div 300,000$ )                         | <u>4.00</u>    |
| Total cost per meal                                             | <u>\$ 8.66</u> |
| c. Material and labor (excluding meat) ( $\$5,720 \div 2,000$ ) | \$ 2.86        |
| Overhead at 300,000 meals                                       | <u>4.00</u>    |
| Total cost without meat                                         | <u>\$ 6.86</u> |
| Cost at 150,000 meals                                           | \$12.66        |
| Cost at 300,000 meals (excluding meat)                          | <u>(6.86)</u>  |
| Maximum meat cost per meal                                      | \$ 5.80        |
| Current meat cost ( $\$3,600 \div 2,000$ )                      | <u>(1.80)</u>  |
| Potential increase in meat cost                                 | <u>\$ 4.00</u> |
| d. $\$21.92 \div 2 = \$10.96$ maximum cost per meal             |                |
| Maximum meal cost                                               | \$10.96        |
| Current costs for material and labor                            | <u>(4.66)</u>  |
| Cost per unit for overhead                                      | <u>\$ 6.30</u> |

Overhead  $\div$  Cost per unit = Total meals

$\$1,200,000 \div \$6.30 = 190,476$  or 192,000 if meals must be produced in 2,000 unit batches

- e. The firm would be less profitable if the manager decided to produce 192,000 dinners but could sell only the same 150,000 the company is currently selling. The manager might accept retaining the business to boost his reputation as a "deal-maker" so as to obtain another position before the financial results were reported.

Current profitability:

|                                                    |                     |
|----------------------------------------------------|---------------------|
| Sales ( $150,000 \times \$25.32$ )                 | \$ 3,798,000        |
| Variable cost of meals ( $150,000 \times \$4.66$ ) | (699,000)           |
| Fixed overhead                                     | <u>(1,200,000)</u>  |
| Profitability                                      | <u>\$ 1,899,000</u> |

**P2-40.**

- a. printing invitations: step fixed  
 preparing the theater: step fixed  
 postage: variable  
 building stage sets: fixed  
 printing programs: fixed  
 security: fixed  
 script: fixed
- b. Members attending =  $300 \times 0.60 = 180$  members  
 Attendance estimate =  $180 + [(90 \times 1) + (90 \times 2)] = \underline{450}$  people

Fixed and step fixed costs =  
 $\$360 + \$900 + \$1,800 + \$350 + \{3 \times [\$110 + (5 \times \$30)]\} + \$2,000 = \$6,190$

Variable cost =  $\$0.60 \times 450 = \$270$

Total cost =  $\$6,190 + \$270 = \underline{\$6,460}$

- c.  $\$6,460 \div 450 = \$14.36$  (rounded)
- d. Member attendance =  $300 \times 0.90 = 270$   
 Attendance estimate =  $270 + (270 \times 2) = \underline{810}$  people

Fixed and step fixed costs =  
 $\$450 + \$1,200 + \$1,800 + \$350 + \{3 \times [\$110 + (5 \times \$30)]\} + \$2,000 = \$6,580$

Variable cost =  $\$0.60 \times 810 = \$486$

Total cost =  $\$6,580 + \$486 = \underline{\$7,066}$

Cost per person =  $\$7,066 \div 810 = \underline{\$8.72}$  (rounded)

The reduction in per-person cost is caused by the fact that, even though some of the step fixed costs increase, the total fixed costs are spread over more attendees.

**P2-42.**

- a. Determining the cost of a product merely involves tracing direct costs to production and finding some systematic method of allocating indirect production costs to products. Controlling these costs involves completely different issues. Control of production costs requires a focus on both the product costs and the related cost drivers. Such costs can be controlled only by controlling the activity levels of the main production cost drivers.
- b. The advancement of technology does make costs more difficult to control. As technology has become more pervasive in manufacturing, the indirect manufacturing costs have grown relative to production volume. Hence, controlling production volume has little to do with the control of more and more production costs. Further, with the growth in the indirect costs (such as automated technology depreciation), it is more difficult to trace production costs to specific products. This difficulty adds to the complexity of cost control because the relationship between production volume and specific products and their product costs is less obvious.
- c. Production volume is no longer as significant a cost driver as it was two decades ago. The growth in both fixed costs and indirect costs suggests that production volume cannot be used as an effective control for a substantial set of production-related costs. However, production volume may still be a valid predictor because it may be reasonably well correlated with the actual cost drivers of these indirect costs and it is still the most significant cost driver for direct production costs.

**P2-43.**

- a. To remain competitive in the global marketplace, businesses must control costs. Provision of health care is creating a crisis for American businesses. In many cases, health-care costs are twice as high for U.S. industries as for their foreign competitors. There is nothing unethical about businesses being concerned about these costs and seeking ways to control them. However, before cutting coverage, businesses have an ethical obligation to identify alternatives. For example, emerging alternatives include managed health care, sharing insurance premiums with employees, and forming alliances with other businesses to directly contract for health-care services. Businesses should be careful to gather employee input on solutions before making any decisions that will adversely affect health-care coverage.
- b. There are no correct or incorrect answers to this question. It is expected that each student will have a relatively unique ranking of the alternatives. This subpart is intended to demonstrate to the students how difficult it is to cut health-care insurance coverage because each worker has different needs and different priorities.
- c. By bringing some health-care services in-house, a firm can replace a portion of the variable costs (per employee) with fixed costs. A company may be able to achieve similar benefits by directly contracting with health-care service providers on a (partly) fixed-fee basis. Likewise, companies can implement health awareness campaigns and provide fitness facilities that will generate long-term health benefits and lower health-care costs. Such approaches will result in an increase in fixed costs and lower variable costs.

**P2-45.**

- a. Direct labor is labor that can be specifically identified with, or physically traced to, a cost object or finished product in an economically feasible manner (such as machine operator labor in a production environment). Indirect labor is all factory labor that is not classified as direct labor.
- b. Certain nonproductive time may be a normal and unavoidable part of total labor time. In such cases, a pro rata share of nonproductive time should be classified as direct labor time. In many cases, nonproductive time is classified as indirect labor because it cannot be identified with a cost object. For example, the amount of downtime usually cannot be identified with a specific cause or particular cost object; it may result from a parts shortage or a broken machine. When there is a shortage of work and employees would therefore be idle, this time can be used for training.
- c. *Direct labor:* The items classified as direct labor can usually be specifically identified with a quantity of labor. Furthermore, other direct costs, such as payroll taxes, are incurred by the organization because of its use of labor.

*Manufacturing overhead:* The items classified as manufacturing overhead usually cannot be specifically identified with direct labor quantities.

*Direct labor or manufacturing overhead:* Some cost items can be classified as either direct labor or manufacturing overhead, depending on the size of the cost object. For example, for very large projects, employee time can be easily associated with the projects (such as the time of specific managers, engineers, draftspersons, janitors, and material handlers). Therefore, all costs associated with these employees can be classified as direct labor costs. For smaller cost objects, such as a variety of products or subassemblies, costs are more difficult to identify with the cost objects and therefore are classified as manufacturing overhead.

- d. The quantity of labor hours that should be included as direct labor or manufacturing overhead reflects a measure of activity. The activity that was performed was either directly related to the product or indirectly related (or not easily traceable) to the product. The dollar amount assigned measures the cost of the activity. Wages and salaries are not necessarily directly tied to production activity. For example, assume a direct labor employee makes \$10 per hour and time-and-a-half for overtime. This employee's activity is no different during the overtime hours—only the wage rate differs. Thus, measurement of activity and measurement of cost must be separated.

**P2-46.**

- a. Overhead costs are the easiest to assign to other classifications since those costs are not directly related to the production of the goods.
- b. Each student will have a different answer, but the following should be considered: the reason for the bank's loan-granting criteria; the effect on the company's suppliers, employees, and customers should this loan not be granted; the ability to manipulate financial income; and the inappropriate "tone at the top" that the president is suggesting.
- c. The memo should contain information as to the nature of costs and the fact that the "cost" of a product can, in many instances, have many different meanings. It should indicate the need for the loan, the ability to provide collateral (if any), and information as to payback. The memo should indicate that the "bottom line" is in excess of the bank's criteria and how this fact could influence the ability to repay. Cash flow from product sales should also be discussed because, without cash flow, income cannot pay back loan amounts.

**P2-47.**

- a. If GP rate is 35 percent of sales, then CGS is 65 percent of sales.  
 $\text{CGS} = 0.65 \times \$1,431,000 = \$930,150$

|                            |                |                    |
|----------------------------|----------------|--------------------|

**P2-50.**

- a. Under GAAP, product cost consists of all amounts that are necessary to manufacture a product. Although direct material and direct labor are clearly traceable to a product and thus should be considered part of product cost, a product could also not be produced without the costs of overhead. In a manufacturing plant, employees need to have some level of supervision and perform some cleanup tasks. Glue, screws, and nails are commonly used to secure parts together. Equipment and utilities must be used. Thus, indirect labor, indirect material, depreciation, and electricity are required to manufacture a product and should be part of that product's cost.
- b. It does not seem reasonable to allocate the depreciation overhead cost of the new equipment to the dog carriers because that equipment is not required for the production of the carriers. For this reason, overhead costs should be separated into different allocation "pools" and allocated to the two product groups based on the cost drivers associated with each allocation pool. This concept is explained in more detail in Chapter 4.
- c. A normal cost system uses a predetermined charge for overhead rather than using the actual amounts that are incurred. One primary component of overhead is utility cost. In Michigan, the utility cost for winter operations could be substantially greater than during the summer. In Hawaii, the climate is consistent year-round, and thus, utility costs should be fairly constant. Because of the large fluctuations in utility costs, a Michigan business might be more likely to want to "smooth" that part of overhead throughout the year by using a predetermined overhead rate.

| Overhead:                                                                        |                |                |                  |
| Indirect labor                                                                   | \$ 40,600      |                |                  |
| Insurance                                                                        | 6,000          |                |                  |
| Utilities                                                                        | 17,800         |                |                  |
| Depreciation                                                                     | <u>230,300</u> | <u>294,700</u> | <u>798,500</u>   |
| Total manufacturing costs                                                        |                |                | \$798,500        |
| Ending WIP inventory                                                             |                |                | <u>(51,000)</u>  |
| Cost of goods manufactured                                                       |                |                | <u>\$747,500</u> |

c. Units completed = Units sold + Units in ending FG inventory  
 $= 200 + (\$97,500 \div \$3,250)$   
 $= 200 + 30$   
 $= \underline{230}$  units completed

d.  $\$747,500 \div 230 \text{ units} = \$3,250$

e.  $200 \times \$3,250 = \$650,000$

f. Sales – CGS = Gross margin  
 $\$1,040,000 - \$650,000 = \$390,000$

**P2-53.**

| Finished Goods Inventory |        |         |     |
|--------------------------|--------|---------|-----|
| BB                       | 24,000 | 502,740 | CGS |
| EB                       | 53,400 |         |     |

Total product cost = Cost of goods manufactured = \$532,140

Period costs for August (all on income statement):

|                             |                  |
|-----------------------------|------------------|
| Office salaries expense (4) | \$144,600        |
| Utilities expense (5)       | 12,060           |
| Depreciation expense (6)    | 12,000           |
| Rent expense (7)            | <u>26,400</u>    |
| Total period cost           | <u>\$195,060</u> |

**P2-54.**

- a. Cost of goods sold for the first 18 days of June:  $\$230,000 \times (1 - 0.40)$   
= \$138,000

Cost of goods sold for the first 18 days of June:

|                            |                            |
|----------------------------|----------------------------|
| Beginning FG inventory     | \$ 29,000                  |
| Cost of goods manufactured | <u>151,500<sup>b</sup></u> |
| Goods available for sale   | \$180,500 <sup>a</sup>     |
| Ending FG inventory        | <u>(42,500)</u>            |
| Cost of goods sold         | <u>\$138,000</u>           |

<sup>a</sup> CGA = \$138,000 + \$42,500 = \$180,500

<sup>b</sup> CGM = \$180,500 – \$29,000 = \$151,500

Cost of goods manufactured for the first 18 days of June:

|                            |                             |
|----------------------------|-----------------------------|
| Beginning WIP inventory    | \$ 48,000                   |
| Direct material used       | 76,000                      |
| Direct labor               | 44,000                      |
| Manufacturing overhead     | <u>42,000</u>               |
| Total cost to account for  | \$210,000                   |
| Ending WIP inventory       | <u>(58,500)<sup>c</sup></u> |
| Cost of goods manufactured | <u>\$151,500</u>            |

<sup>c</sup> Ending WIP Inventory = \$210,000 – \$151,500 = \$58,500

- b. The insurance company would want to substantiate the quantity and cost of the inventory. The company would require nonfinancial records including labor, material, and production. The insurance company might also require some verification of the market value (current value or replacement value) of the inventory. Further, it might require the company to substantiate the number of units in the WIP inventory and the average percentage of completion. The market value data could be obtained from industry publications and the unit data might be obtained from production records or internal receiving and shipping documents.
